
1 News: January, 2008

Testing:

On January 24th, we began a long term 177°C test of our piezo circuit. We will continue to monitor the reliability and performance of the tool on a weekly basis. Our surface mount quartz memory circuit has been qualified to 177C and will begin 200C testing in February.

Engineering:

We have completed the prototype design of a battery tester and will begin our first production order.

We have completed the beta version of our reporting software. Operators can now create simple and effective build up and gradient reports.

The effective resolution of our piezo tool was increased and is now 8x the industry standard.

Request our "Piezo Sensor Tech Guide" for a detailed explanation of our technical improvements

Events:

We have secured a booth (# 1817) at this year's off-shore technology conference in Houston.

The conference runs from May 5th to 8th and we invite all of our customers and vendors to come and join us.
